

The Italian company Nord Group, which has more than 30 years of experience in industrial engineering, has launched a project of exploitation and production of chromium concentrate in Albania, in Librazhd, near the border with Macedonia. The project is managed by a branch North Mining Group.

This is the most important plant for the production of chromium concentrate in Albania. It is expected that turnover in 2017 will reach five million euros, and that it will rise to 20 million euros by 2020. The plan is to increase the number of employees from 100 to 400.
