

[Electricity consumption](#) in [Greece](#) fell by 18 percent between January and December 2022 - from 4.88 TWh in January to 4.01 TWh in December, data from transmission system operator **ADMIE** shows.

The consumption of electricity fell continuously in the period from July to November. In July, consumption was reduced by 12 percent, in August by 13 percent, and in September by 3 percent. A more noticeable drop in consumption was recorded during autumn, due to warm weather and a drop in heating consumption - by 9 percent in October and by 12 percent in November. In December, after five months, this trend was reversed and consumption increased to 4.01 TWh.

In the period January - November 2022, the consumption of natural gas was also reduced by 18 percent, data from the Natural Gas System Operator **DESFA** showed.

In this way, Greece created the conditions for achieving the European goal of reducing electricity and gas consumption in the period August 2022 - March 2023, by 15 percent, i.e. five percent in peak hours compared to the five-year average.
