

Montenegro: TSO company CGES complied with ENTSO-E standards

Categories : [SEE Energy News](#)

Date : July 7, 2016

After the technical control and verification of fulfillment of certain technical criteria, the Commission for system operation within ENTSO-E concluded that the Montenegrin operator of electricity transmission system CGES performs its operation in emergency situations in a manner fully compliant with 20 out of 21 prescribed EU standards.

Also, the Commission concluded that the appliance of this one remaining standard is incomplete, but sufficient enough to comply with the procedures prescribed in emergency situations in the European Union.

In addition to the very highest marks of compliance, the Commission pointed out that CGES was very well prepared for the actual auditing.

Compliance Monitoring Program (CMP) is a program of the ENTSO-E association (European Network of Transmission System Operators) which aims to constantly evaluate compliance with the standards of the association through the annual process of self-assessment and annual process of mandatory audits, which is carried out periodically at random transmission system operators.

Sub-Group Compliance, Monitoring and Enforcement (SG CME) is responsible for the implementation of the aforementioned process. It should be noted that 2016 is the seventh year of implementation of the mandatory compliance audit and that SG CME has already carried out four voluntary compliance audits between 2008 and 2009 and 43 mandatory audits between 2010 and 2016, transmits [Serbia-energy.eu](https://serbia-energy.eu)
