

According to the National Energy Strategy, the Romanian energy sector needs investment of about 100 MEUR between 2015<sup>th</sup> and 2035<sup>th</sup>

In order to attract new investments in the energy sector, Romania has to provide a stable, predictable and transparent market, through strategy and public policy. The required investment for a period of 20 years amount to about 100MEUR. This context requires the development of policy priorities in order to stimulate investments in energy, as well as policies that could facilitate the implementation of concrete measures. The transformation of the energy sector must be supported by significant investments over the next decade, mainly in the field of energy efficiency, new energy generation capacities, transmission and distribution, as well as improving and increasing the efficiency of the existing ones, reports Romanian Agerpres.
