

Romania, Hungary: Power trading, exporter will be a country with lower energy prices

Categories : [SEE Energy News](#)

Date : July 20, 2015

Commercial transactions on the electricity stock exchange between Romania and Hungary started by mechanisms connection, for day- ahead market, and at the moment when the energy prices in two states are different at certain intervals.

"This means that the country in which the price is lower, will import, while the country where the price is lower will export. Import / export occurs while the price in the two countries equals, if there is sufficient capacity for the exchange across the border. If the exchange capacities would be reached before prices equalization, then prices remain different", energy regulator ANRE transmitted.

In other words, Romania will import energy only when the domestic price is higher than in Hungary, while exports will be carried out when the situation is reversed. , transmits Serbia-energy.eu
