

Wind energy integration into Serbian grid, the capacities vs the law limits in MW created a competition

Categories : [Uncategorized](#)

Date : June 6, 2012

Serbian renewable energy potentials and future green kwh electricity are huge and yet to be explored by a number of foreign companies who entered the Serbian and regional energy RES market. Serbian wind energy potentials are huge and considering the number of foreign developers Serbia actually got a real wind energy projects competition. The fact that Serbian grid has certain limits for integrating the wind kwh brought the fierce competition on the market. The energy law set certain limits, the grid network company assessed the current and future potentials but also projected needed investments for grid operation with wind kwh in the system. FiT system for green kwh is quite perspective so one might expect that the green market including the wind energy market will only be more competitive in the future.

So far, the Serbian transmission system operator EMS has issued only opinions on the possibility of network connection for the projects in Vr
